Figure 1: Terminalia ferdinandiana Exell. (family Combretaceae), commonly known as as Kakadu plum, gubinge, billy goat plum and salty plum, is an endemic Australian tree which occurs in tropical grassland regions of northern Australia. The fruit has traditional uses for indigenous Australians as nutritious food and as a medicinal plant.<sup>1,2</sup> Recent studies have reported Kakadu plum to be extremely high in antioxidants and to be the richest naturally occurring source of vitamin C.<sup>3,4</sup> As high antioxidant levels have previously been demonstrated to act as preventative effects against the development of degenerative chronic diseases such as cancer, cardiovascular diseases, neural degeneration, diabeties and obesity, it has been postulated that Kakadu plum fruit may also be an effective preventative against these diseases.<sup>2</sup> Recent studies have shown Kakadu plum fruit extracts to be effective at inhibiting the growth of a panel of bacterial pathogens, including P. mirabilis, K. pneumoniae, A. baylyi, P. aeruginosa,<sup>5-7</sup> Clostridium perfringens,<sup>8</sup> and Yersinia entercolitica,<sup>9</sup> as well as food spoilage<sup>10</sup> and body odour forming bacteria.<sup>11</sup> Notably, recent studies have demonstrated that T. ferdinandiana extracts are also effective against MRSA and some ESBL bacterial strains.<sup>12</sup> Fruit and leaf extracts of this species are also effective against dermal fungal pathogens.13 Additionally, extracts prepared from T. ferdinandiana fruit also inhibit Giardia duodenalis growth and may therefore be useful in the treatment of giardiasis.<sup>14,15</sup> Terminalia ferdinandiana extracts also inhibit the proliferation of multiple cancer cell lines via the induction of apoptosis.<sup>3</sup>

Figure 2: Pittosporum angustifolium Lodd. (Family Pittosporaceae; formerly known as Pittosporum phillyreoides DC.; commonly known as gumbi gumbi, native apricot, weeping pittosporum, butterbush, cattle bush, poison berry bush and berrigan) is an endemic Australian plant which is distributed in arid inland areas of the Australian continent. Australian Aborigines used P. angustifolium as a medicinal plant to treat a wide variety of conditions.<sup>1,16</sup> Decoctions and infusions prepared from the leaves inhibit a variety of bacterial, fungal and viral pathogens.<sup>1,17</sup> A decoction of fruit was also used both externally and by ingestion to treat eczema and pruritus. Anecdotal reports have also associated P. angustifolium leaf preparations with anticancer properties18 and this species is sometimes referred to as 'Queensland anticancer tree'. Furthermore, P. angustifolium extracts have been reported to have moderate cytotoxic activity towards A427 lung cancer cells,<sup>19</sup> Despite its range of traditional medicinal uses, the phytochemistry and therapeutic potential of P. angustifolium has not been extensively examined. One study reported that P. angustifolium leaf extracts inhibit Ross River virus induced cytopathicity by more than 25%, but are ineffective against poliovirus and cytomegalovirus. A more recent study reported broad spectrum antibacterial activity of P. angustifolium leaf extracts against a panel of enteric bacteria.<sup>17</sup> Furthermore, a recent study not only confirmed the antibacterial activity of this plant, but also reported that P. angustifolium extracts potentiated the activity of tetracycline against bacterial otherwise resistant to its actions.<sup>20</sup> Photograph was taken by Dr Ian Cock at Arid Lands Botanical Gardens, Port Augusta, Australia, February 2021.
